**MU SECURITY WINS INFORMATION SECURITY MAGAZINE 2007
READERS' CHOICE AWARD**

**Mu-4000 Security Analyzer Awarded "Silver Medal" in Emerging Technology
Category**

Sunnyvale, Calif. – April 3, 2007 – Mu Security, the leader in the new security analyzer market, today announced that its Mu-4000 Security Analyzer has been selected by the editors of TechTarget's Information Security Magazine and SearchSecurity.com for a "Silver" 2007 'Readers' Choice Award. A total of 1,595 information security executives and managers evaluated 340 products in 15 product categories being deployed within their organizations to determine award winners.

"We are very pleased to receive this recognition from a base of more than 1,500 executive decision makers in the IT security industry," said Adam Stein, vice president of marketing at Mu Security. "The Awards singled out the Mu-4000 from 45 new or enhanced products spanning 15 product categories that IT professionals recommend adding to their A-list of security products to evaluate."

Nine months in the making, the Awards reflect extensive, in-depth discussions and interviews between TechTarget editors, security technology experts, and the Information Security Editorial Advisory board. The collective experience of these experts originating from service providers, cable operators and product developers helped define the appropriate categories. Mu Security's continued growth in defining the emerging Security Analyzer product category exemplifies the highly granular or specific criteria

required to encompass the most critical security technologies and service availability functionality for any IP-based product.

The Mu-4000 Security Analyzer platform utilizes a systematic and repeatable process to identify unknown and known security vulnerabilities in any IP-based system, application or network device without requiring access to any source code. This helps ensure all new and existing IP-based systems are always available for their end-user network and immune from hacker attacks. Mu Security end users, such as Service Providers and larger enterprises, ensure their networks are always operational using the Mu-4000 including analysis of IPTV provisioning products, VoIP systems, routers, 3G equipment, triple-play service offerings. The wide range product developers producing increasingly complex IP-based software and hardware benefit with an automated means to discover both unknown 0-day and published vulnerabilities during initial development, update or post-deployment customer support.

About Mu Security (<http://www.musecurity.com>)

Mu Security offers a new class of security analysis system, delivering a rigorous and streamlined methodology for verifying the robustness and security readiness of any IP-based product or application. Founded by pioneers of intrusion detection and prevention technology, Mu Security is backed by preeminent venture capital firms that include Accel Partners, Benchmark Capital and DAG Ventures. The company is headquartered in Sunnyvale, CA.
